HEALTHCARE DESIGN

Mediline Horizontal Bedhead Unit

The Mediline horizontal bedhead unit offers an ergonomic, compact stylish solution to deliver essential services to the patient. The units are configured to suit each individual installation or project requirement with modules supplied fully assembled as standard. Electrical sockets, nurse call, data and medical gases are fitted to meet each individual client specification.

Electrical sockets are fitted to individual accessory plates and can be fully wired and tested with essential/non essential sockets available for standard ward areas and blue isolated earth sockets for A&E, critical care or operating departments.

Medical gas terminal units from all manufacturers can be accommodated with modules available as either fully pregassed and tested systems or alternatively, mounting plates can be included for installation of the gas outlets by the medical gas contractor on site.

Any type of nurse call can be easily integrated with provision for a bespoke nurse call plate which can also fit the required number of data outlets. The design of the units ensures correct separation is maintained between electrical, data and medical gases.

The units can be fed either via a bespoke surface mounted vertical riser section, through the back of the unit through the main body or through the side of the unit through the end cap.

Specifications:
